PhD. Alejandro Paredes

Cuadratura de Gauss

Deseamos aproximar I a una suma ponderada de evaluaciones $f(x)$ sobre $N + 1$ puntos

$$I = \int_a^b \omega(x) f(x) \approx \sum_{j=0}^N w_j f(x_j)$$

- Los w_j se denominan funciones de peso y los puntos x_j se escogen apropiadamente.
- Los límites de integración $a, b \in \mathbb{R}$ e inclusive pueden ser $\pm\infty$.
- Referencia: Shen, Tang, Wang, Spectral Methods, Algorithms, Analysis and Applications.

Polinomios ortogonales

Sobre $I = (a, b)$ ($-\infty \leq a < b \leq +\infty$), la función genérica de peso ω sea tal que

$$\omega(x) > 0, \forall x \in I \text{ y } \omega \in L^1(I)$$

Dos funciones $f(x)$ y $g(x)$ son ortogonales respecto de ω , si

$$(f, g)_\omega = \int_a^b \omega(x) f(x) g(x) dx = 0$$

Un polinomio de grado n

$$p_n(x) = k_n x^n + k_{n-1} x^{n-1} + \dots + k_0, \quad k_n \neq 0$$

Una familia de polinomios se dice ortogonales, si

$$(p_n, p_m)_\omega = \int_a^b \omega(x) p_n(x) p_m(x) dx = \gamma_n \delta_{mn} \quad \gamma_n = \|p_n\|_\omega^2 \neq 0$$

Polinomios ortogonales

Polinomio	Intervalo	Función peso $\omega(x)$	γ_n
Legendre	$[-1,1]$	1	$\frac{2}{2n+1}$
Laguerre ($\alpha > -1$)	$[0, +\infty]$	$x^\alpha e^{-x}$	$\frac{\Gamma(n+\alpha+1)}{n!}$
Hermite	$[-\infty, \infty]$	e^{-x^2}	$\sqrt{\pi} 2^n n!$
Chebyshev	$[-1,1]$	$\frac{1}{\sqrt{1-x^2}}$	$\frac{c_n \pi}{2}$ $c_0 = 2, c_n = 1 \text{ } n \geq 1$

$$\bar{p}_{n+1} = (x - \alpha_n) \bar{p}_n - \beta_n \bar{p}_{n-1} \quad \alpha_n = \frac{(x \bar{p}_n, \bar{p}_n)_\omega}{\|\bar{p}_n\|_\omega^2} \quad n \geq 0 \quad \beta_n = \frac{\|\bar{p}_n\|_\omega^2}{\|\bar{p}_{n-1}\|_\omega^2} \quad n \geq 1$$

$$\bar{p}_0 = 1, \bar{p}_1 = x - \alpha_0$$

Cuadratura de Gauss

Deseamos aproximar la integral utilizando $N + 1$ puntos sobre el intervalo $[a, b]$

$$\int_a^b \omega(x) f(x) dx = \sum_{j=0}^N \omega_j f(x_j) + E_N[f]$$

Error de la cuadratura:
$$E_N[f] = \frac{1}{(N+1)!} \int_a^b f^{N+1}(\zeta(x)) \prod_{i=0}^N (x - x_i) dx \quad \zeta(x) \in [a, b]$$

Si tomamos $f(x) = h_j(x)$ (pol de Lagrange $h(x)$ de grado N interpolado en los puntos x_j)

$$h_j(x) = \prod_{i=0; i \neq j}^N \frac{(x - x_i)}{(x_j - x_i)} \Rightarrow E_N[f] = 0 \quad f(x_j) = 1 \quad \omega_j = \int_a^b h_j \omega(x) dx \quad 0 \leq j \leq N$$

Cuadratura de Gauss

Teorema : Sean los puntos $\{x_j\}_{j=0}^N$ las raíces del polinomio orthogonal (respecto de $\omega(x)$) p_{N+1} . Entonces existe un único conjunto de $\{\omega_j\}_{j=0}^N$ definido por

$$\omega_j = \int_a^b h_j \omega(x) dx \quad 0 \leq j \leq N \quad \text{tal que}$$

$$\int_a^b \omega(x) p(x) dx = \sum_{j=0}^N \omega_j p(x_j) \quad \forall p \in P_{2N+1}$$

$$\int_a^b \omega(x) f(x) dx \approx \sum_{j=0}^N \omega_j f(x_j)$$

Además

$$\omega_j = \frac{k_{N+1}}{k_N} \frac{\|p_N\|_{\omega}^2}{p_N(x_j) p'_{N+1}(x_j)} \quad 0 \leq j \leq N$$
